# The Perfect Choice to add revenue to your business

WellaWave is easy to operate, light weight for mobile spas and powerful enough for high volume spas. WellaWave allows you to generate a sizable income with minimal investment and effort. The great thing about these treatments is that they work themselves. Once your client is set and comfortable, you may tend to other clients in your spa. Wellawave works for both men and women.

## What is EMS?

EMS - or Electrical (or Electronic) Muscle Stimulator. A device where electricity is used to activate muscle groups externally through the skin. This is often done for purposes of passive exercise, muscle toning, beauty treatments, and physical therapy.

## How Does EMS Work?

Electronic muscle stimulators as an exercising and fitness aid is nothing new. Electrical muscle stimulation is widely used in rehabilitation to strengthen skeletal muscle and many professional athletes use electrical muscle stimulators to help supplement their fitness exercise routines or just as a means of maintenance on those particular days they're unable to workout either through muscle injury or lack of time. Muscle stimulators are ideal for physically challenged individuals, those living sedentary lifestyles, those in need of getting toned and trimmed fast, and those presently going through physiotherapy.

Electricity has been used to treat pain for over 100 years. Early proponents of electricity were labeled as charlatans, but recent scientific studies have proven that it can reduce both acute and chronic pain. Electrical Muscle Stimulation is used to break muscle spasms and help reduce pain. It may directly block transmission of pain signals along nerves. In addition, electrical stimulation has been shown to promote the release of endorphins, which are natural painkillers produced by the body. Several different electrical stimulation approaches exist, each producing different effects. These devices are powered by batteries, some units have an adapter that allows powering from an outlet and they provide electrical stimulation to nerves and muscles via adhesive pads placed on the skin.

## EMS For Slimming Machine

Many functions of the body are controlled by neurological electrical impulses. These impulses are transmitted naturally by the brain to specific organs. The WellaWave Program simply imitate each one of these specific impulses in order to produce a range of different results such as slimming, muscle tone, workout, cellulite reduction, non surgical facelift and many more. The high-tech toning treatment fires electrical impulses through pads that imitate the way your body reacts to working out.

# What Happens

## During a WellaWave Treatment ?

During a brief consultation, you'll be asked which body parts you'd most concerned and unhappy about. You will undress to your undergarments. You will then be measured at various points of your body. Some therapists take photos to document your improvement. The electro pads are then placed to your problem areas on your body. You will then relax on a table. You will be covered with blankets if needed. The treatment last between 35-60 minutes.

Using revolutionary micro technology, the WellaWave electronically simulates the body's impulses to reshape the body .The soothing and pleasurable biowave signals, delivered in a series of biologically coded frequencies, instantly accesses different body areas. Skin, fat, muscle, connective tissue, the circulatory and lymphatic systems are stimulated effectively to slim, tighten, tone, lift, firm, shape and rejuvenate.

WellaWave programs send out the appropriate sequence of signals to produce the correct treatment parameters. For example, when you exercise, natural impulses cause your muscles to contract and relax. The Wellawave mimics these natural impulses and makes the muscles contract and relax in such a pattern. This is done with lower risk of strain or fatigue. A WellaWave program can be more targeted, more prolonged and more efficient than even traditional physical exercise.
